UNIT 6: Practical Skills in						
OIVIT O. Practical Skills III	Chemistry ii					
You must have: Scientific calculator	Total Marks					

Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided
 - there may be more space than you need.

Information

- The total mark for this paper is 50.
- The marks for each question are shown in brackets
 - use this as a guide as to how much time to spend on each question.
- You will be assessed on your ability to organise and present information, ideas, descriptions and arguments clearly and logically, including your use of grammar, punctuation and spelling.
- A Periodic Table is printed on the back cover of this paper.

Advice

- Read each question carefully before you start to answer it.
- Show all your working in calculations and include units where appropriate.
- Check your answers if you have time at the end.

Turn over ▶

Answer ALL questions. Write your answers in the spaces provided.

- 1 This question is about copper and some of its compounds.
 - (a) Two tests were carried out on separate samples of an aqueous solution of copper(II) sulfate.
 - (i) **Test 1**

A few drops of aqueous sodium hydroxide were added to a sample of the copper(II) sulfate solution.

State what you would see.

(1)

(ii) Test 2

A few drops of concentrated hydrochloric acid were added to another sample of the copper(II) sulfate solution.

More of the concentrated hydrochloric acid was added until it was present in excess.

Describe the changes th	at would be o	bserved d	uring this test
-------------------------	---------------	-----------	-----------------

(2)

(b)	Describe a test, and its positive result, to confirm the presence of the sulfate ion in
	another sample of the copper(II) sulfate solution.

(2)

(c) An electrochemical cell was made from the electrode systems represented by these half-equations:

Cu²⁺(aq) + 2e⁻
$$\rightleftharpoons$$
 Cu(s) $E^{\ominus} = +0.34V$
Fe³⁺(aq) + e⁻ \rightleftharpoons Fe²⁺(aq) $E^{\ominus} = +0.77V$

(i) Calculate $E_{\text{cell}}^{\ominus}$ for the electrochemical cell.

(1)

(ii) A student drew a diagram of an experiment to measure the standard emf of the cell.

Identify three mistakes in this diagram and the changes needed to correct them.

Assume that standard conditions were used.

(d) Brass is an alloy of copper and zinc.A student determined the percentage of copper in a sample of brass.

Procedure

- weigh the sample of brass
- place the brass in a beaker and add concentrated nitric acid until all the brass dissolves
- transfer the solution and washings to a 250.0 cm³ volumetric flask
- make the solution up to the mark with distilled water and mix well
- pipette 25.0 cm³ of the solution into a conical flask
- neutralise the excess nitric acid in the solution
- add 10 cm³ of potassium iodide solution (an excess) to the conical flask
- titrate the iodine produced with 0.100 mol dm⁻³ sodium thiosulfate solution using starch indicator
- repeat the titration until concordant titres are obtained.
- (i) Copper and zinc both react with concentrated nitric acid to form the metal nitrates, nitrogen dioxide and water.

Write the balanced equation for the reaction of zinc with concentrated nitric acid.
State symbols are not required.

(1)

(ii) Name the most suitable piece of apparatus to measure the 10 cm³ of potassium iodide solution.

(1)

(iii) State at what point in the titration the starch solution should be added.

(1)

(iv) Only Cu²⁺ ions in the solution react with the aqueous potassium iodide.

$$2Cu^{2+} + 4I^{-} \rightarrow 2CuI + I_{2}$$

The iodine reacts with sodium thiosulfate solution.

$$2S_2O_3^{2-} \ + \ I_2 \ \to \ S_4O_6^{2-} \ + \ 2I^-$$

Results

Mass of brass sample = 3.90 g

Mean titre of $0.100 \, \text{mol dm}^{-3}$ sodium thiosulfate solution = $28.60 \, \text{cm}^3$

Calculate the percentage, by mass, of copper in this sample of brass. Give your answer to an appropriate number of significant figures.

(5)

2 Two organic compounds, **A** and **B**, are colourless liquids.

Each compound contains only **one** functional group.

- (a) Two tests were carried out on **A**. The observation for each test was recorded in the table.
 - (i) Complete the statements in the inference column by writing the names or formulae of the functional groups.

(2)

Test	Observation	Inference
Test 1		A could contain
A few drops of A were added to 2 cm ³ of a solution of 2,4-dinitrophenylhydrazine (Brady's reagent)	An orange precipitate formed	or
Test 2		
A few drops of A were added to 2 cm ³ of Fehling's solution		The functional group present in A is
The mixture was warmed in a water bath	A red precipitate formed	

(ii) Give the name or formula of the red precipitate formed in **Test 2**.

(1)

(b) A simplified mass spectrum of **A** is shown.

(i) Give the formula of **one** of the ions responsible for the peak at m / z = 29.

(1)

(ii) A contains one functional group.

Give the m/z value of the molecular ion and the structure of **A**.

(1)

m / z value of the molecular ion

structure of A

- (c) Two tests were carried out on **B**.
 - (i) Complete the statements in the observation and inference columns.

(2)

Test	Observation	Inference
Test 3		
2 drops of B were dissolved in 2 cm ³ of water		
A few drops of Universal Indicator were added to the solution	The colour of the mixture was	The solution is alkaline
Test 4		
B was added drop by drop to aqueous copper(II) sulfate	A pale blue precipitate formed with the first few drops of B	The name of the functional group in B is
until B was present in excess	This dissolved to form a deep blue solution when excess B was added	

(ii) **B** has a molar mass of 59 g mol⁻¹.

Suggest a structure for **B**.

3 A student carried out an experiment to determine the enthalpy change when solid lithium chloride, LiCl, dissolved in water to form a solution.

Procedure

- Step 1 Use a pipette to place 25.0 cm³ of distilled water into a polystyrene cup.
- Step 2 Measure and record the initial temperature of the water.
- Step 3 Add 2.12g of lithium chloride to the water.
- Step **4** Stir the mixture and record the highest temperature reached.
- (a) Give a reason why a polystyrene cup was used instead of a glass beaker in Step 1.

(1)

(b) The temperature rise was 12.5 °C.

Calculate the enthalpy change for the formation of this solution of lithium chloride.

Include a sign and units in your answer.

[Assume: specific heat capacity of the solution = $4.18 \,\mathrm{Jg^{-1} \, {}^{\circ}C^{-1}}$ density of the solution = $1.00 \,\mathrm{g\,cm^{-3}}$]

(3)

(c)	The thermometer used to measure the temperature change had an uncertainty of $\pm 0.25^{\circ}\text{C}$ for each measurement.	
	Calculate the percentage uncertainty in the temperature change in this experiment.	
		(1)
	The temperature rise in this experiment was lower than expected, due to heat loss to the surroundings.	
	Describe changes to the procedure that would give a more accurate temperature rise.	
	Include the use of a stopwatch and details of a graph you would plot.	(5)

4 This question is about the alkaline hydrolysis of an ester, X.

X is an alkyl benzoate and can be represented by the formula C_6H_5COOR , where R is the alkyl group.

The equation for the hydrolysis is

$$C_6H_5COOR + NaOH \rightarrow C_6H_5COONa + ROH$$

Procedure

- Step 1 Measure 5.0 cm³ of **X** and pour it into a pear-shaped flask. Add 25 cm³ (an excess) of aqueous sodium hydroxide solution and a few anti-bumping granules.
- Step 2 Heat the flask and contents under reflux for 20 minutes.
- Step **3** Allow the apparatus to cool and then rearrange it for distillation. Distil the mixture and collect about 2 cm³ of the alcohol ROH.
- Step 4 Allow the pear-shaped flask to cool, pour the contents into a beaker and add excess dilute hydrochloric acid.

 Impure benzoic acid forms as crystals in the mixture.
- Step **5** Recrystallise the benzoic acid using water as the solvent.
- Step **6** Weigh the dry crystals and determine their melting temperature.

(a) A student drew a diagram of the apparatus set up for distillation in Step 3.
 There are three errors in the diagram.
 Assume the apparatus is clamped correctly and an appropriate heat source is used.

nd how they should be corrected.	(3)

(c) (i) Write an equation for the reaction taking place in Step 4. Use structural formulae for the organic substances. State symbols are not required. (1) (ii) State what should be done to separate the benzoic acid from the mixture produced in Step 4, before carrying out Step 5. (1) (d) Describe the first stage in the recrystallisation process in Step 5. (1) (e) The melting temperature of pure benzoic acid is 122 °C. State two ways in which the melting temperature changes if the benzoic acid is not pure.	Describe a chemical test, and its positive result, to show the presence of an –OH group in any alcohol.	
Use structural formulae for the organic substances. State symbols are not required.
